

### VISCOUS VS. MOLECULAR FLOW LEAKS

The flow regime encountered in leak testing is often difficult to determine. It can, however, be estimated by calculating the average mean free path of the gas molecule (l) divided by the estimated leak path diameter (d). Use the following guidelines to determine the flow regime:

**VISCOUS FLOW** leaks typically occur in systems leaking at atmosphere or larger pressures (l/d < 0.01). Viscous leaks are typically larger than 10<sup>-5</sup> atm-cc/sec, but can occur at lower leak rates.

**MOLECULAR FLOW** leaks typically occur under vacuum conditions (l/d > 1.00). Molecular leaks are typically smaller than 10<sup>-5</sup> atm-cc/sec.

**TRANSITIONAL FLOW** occurs between viscous and molecular flow regimes (0.01 < l/d < 1.00).

| LEAK RATE CONVERSIONS |                         |                |
|-----------------------|-------------------------|----------------|
| CONVERT FROM          | MULTIPLY BY             | CONVERT TO     |
| atm-cc/sec            | 1.013                   | mbar-liter/sec |

### LEAK RATE VS. PRESSURE

Viscous Flow:  $Q_v = K/n (P_1^2 - P_2^2)$

Molecular Flow:  $Q_m = K(T/M)^{1/2} (P_1 - P_2)$

Where:

- Q = Leak Rate
- K = Constant relating leak path geometry
- n = Gas Viscosity
- M = Gas Molecular Weight
- T = Absolute Temperature
- P<sub>1,2</sub> = Upstream and Downstream Absolute Pressure

Example: A helium leak in the viscous flow regime with 10 atm upstream (internal) and 1 atm downstream pressure has a leak rate of 0.001 atm-cc/sec. If the upstream pressure was doubled to 20 atm the new leak rate would be:

$$Q_{V,NEW} = Q_{V,OLD} ((P_{1,NEW}^2 - P_{2,NEW}^2) / (P_{1,OLD}^2 - P_{2,OLD}^2))$$

$$Q_{V,NEW} = 0.001((20^2 - 1^2) / (10^2 - 1^2)) = 0.004 \text{ atm-cc/sec}$$

Using the table above the equivalent leak rate for air under the same conditions is:  $Q_{V,AIR} = 0.004(1.08) = 0.0043$
